

# Eco Drop Shower

Saving water has become one of the most important habits of a modern-day human being but we all know that for most people self-regulation is damn near impossible, especially when you are under a good, long, hot shower. About 20% of all energy spent in the home comes from the hot water used in the bath - six times more than home lighting, for example.

This eco-friendly shower will force you to get put when you take too long and waste much water. The concentric ripples in the floor will rise, causing discomfort to the point where you can no longer stand it. It's a great way to save water for those unable to regulate their time.

I think this design should be used in gyms and public showers. People take longer when the resources are free, this will help cut that down.
