

Rain in the Bathroom

The system "Rain in the Bathroom" appears with the aim of stopping the waste of drinking water in the toilets.

Introduction of gutters in dwellings that directs rainwater to a reservoir. In the water route from the gutter to the reservoir, the water goes through several filters of different dimensions to not carry large particles to the reservoir. This reservoir that is installed in the house will have the usefulness of storing rainwater for the consumption of undrinkable water in flushing discharges.

Disadvantages: Quick colmatation of the filters; Water scarcity in summer;
