

Is it worth it?

Is it worth it to spend enormous amounts of water for us to eat that specific meal? Or should we consider something that doesn't use those quantities?

Implementing the thought

For us to implement this way of thinking in the population, I thought we could we could go to the local restaurants and use their menu.

In front of every dish put the quantity of water used to produce it and this way everyone could see and think about that while choosing their meal.

This not only warns the population about the excessive consumption of water and also warns the owners of the restaurant.

The owners of the restaurant can lower their water consumption by trying to buy their products locally and this way, they can reduce not only the quantity of water used, but also in the money they spend on providers, since the expenses of dislocation are reduced, and this not only helps economically the owners but also helps the environment.

Sustainable stars

In order to motivate the owners to buy locally, there could be a scale of stars from 1 to 5, which 5 is the most sustainable restaurant.

The restaurants were rated with them regarding their choices and their effort to be more sustainable.

The ones with more stars were more publicize among the community in order to gain more customers and to be continue doing their great job at being sustainable.
